EXECUTIVE SUMMARY

In 2021, the City of Tucker, GA commissioned Stantec Consulting Services Inc. (Stantec) to provide pavement management services that would provide an objective approach to the development of the City's street rehabilitation process. In this regard, a pavement condition assessment was undertaken on the City's road network and a pavement management system analysis was performed to identify rehabilitation needs and funding impacts on upcoming pavement rehabilitation cycles.

The City is responsible for maintaining approximately 170 centerline miles (CL-MI) of road (368 lane miles (LN-M)). As summary of the City's network by functional class is provided below in Table ES.1.

Table ES.1: City of Tucker Road Network Distribution - 2021

Functional Class	No. of Sections	Length (CL-MI)	Length (LN-MI)
Local	1,043	132.7	269.9
Collector	147	18.9	40.1
Minor Arterial	118	13.1	38.5
Major Arterial	26	4.9	19.0
Total Network	1,334	169.6	367.5

In June 2021, a pavement condition assessment was done on all City maintained streets. To capture the pavement condition data (Surface Distresses and Ride Quality), Stantec utilized its Road Tester 3000 (RT-3000) vehicle. This equipment is a fully mobile solution specifically developed to collect pavement condition data accurately and efficiently. Integrated with lasers, inertial GPS, and high-definition digital imagery, the RT-3000 simultaneously collected pavement profile, rutting, surface distress, roadway geometrics, pavement and right-of-way (ROW) imagery on the City streets at posted speed limits without impacting local traffic.

Pavement condition was determined using industry standards of measuring roughness and rating various types of defects found on the City's roads during the inspections.

Each defect was measured on the basis of two components:

- **Severity** is defined as '**How bad is the defect?**' in terms of the width or degree of wear associated with the condition. An example of a severity measurement includes the width of a crack.
- **Extent** or '**How much is there?**' relates to the quantity of the road that the defect impacts. Examples of measures used for extent would include the number or length of linear cracking, the number of potholes observed, or the pavement area affected by alligator cracking.

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Executive Summary
January 4, 2022

Each distress was measured and tagged with a linear reference and corresponding GPS coordinates. The distress data was collected continuously, processed and aggregated to compute a **Pavement Condition Index (PCI)** for each pavement section on a 0 to 100 score. A PCI score of zero (0) indicates a pavement in the worst possible condition, whereas a PCI score of 100 indicates a pavement in the best possible condition.

The pavement condition rating of a road can be described using the PCI condition categories shown below in Table ES.2.

Table ES.2: PCI Condition Category

PCI Range	Condition Category
86 - 100	Excellent
71 - 85	Good
56 - 70	Fair
41 - 55	Poor
26 - 40	Very Poor
0 - 25	Serious

Ride quality was measured in terms of the International Roughness Index (IRI) in both wheel paths. Ride Quality is converted to a Ride Comfort Index (RCI) within Stantec's pavement management system (RoadMatrix). RoadMatrix was used to complete the following types of analyses:

- Establishing the current street network condition (Present Status) in terms of pavement surface distresses and ride quality (roughness),
- Identifying The needs for pavement rehabilitation treatments (Needs Analysis), and
- Prioritizing potential work that is required, using cost-benefit and cost effectiveness principles, for various funding levels (Priority Programming).

Present Status Results

The lane-length weight average Pavement Condition Index (PCI) for City maintained streets in 2021 was 64. This includes the added benefit that resulted from doing rehabilitation work on approximately 1.7 centerline miles of roads within the City after the condition data was collected.

This network average PCI score of 64 indicates that the City's road network is providing a "FAIR" level of service to the road users. The lane-length weighted average RCI is also 64 indicating a "GOOD" ride quality overall. A map showing the 2021 PCI results colored by condition category is provided below in Figure ES.1.

Needs and Budget Analysis Results

Using RoadMatrix, appropriate maintenance and rehabilitation (M&R) treatment needs, and associated costs were determined based on current and projected conditions over time. As well, RoadMatrix determines the most cost-effective timing to perform the required M&R over a ten-year period.

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Executive Summary
January 4, 2022

The “Needs” analysis results indicate that approximately 48 % of the road network is labeled as “deficient” and requires some form of rehabilitation work based on the 2021 pavement condition assessment. Over a ten-year analysis period (2022-2031), approximately \$44.3 Million in pavement rehabilitation is needed to deal with all of the “deficient” sections. It is noted that a road section is labeled as “deficient” if its PCI falls below the performance thresholds identified for each functional class. These thresholds are PCI = 55 for Local roads, PCI = 60 for Collector roads, PCI = 65 for Minor Arterial roads and a PCI = 70 for Major Arterial roads.

Various budget scenarios were run to determine which roads have the greater priority to be funded, and the potential impact that funding levels will have on the overall condition of the road network over time. In this regard, a “Priority Programming” analysis for a ten-year period, beginning in 2022, was conducted for five budget scenarios in addition to the Network Needs (unlimited funding) scenario. The budget analysis results are summarized below in Table ES.3.

Table ES.3: Budget Analysis Results Summary

Budget	Total Cost (10 Years)	PCI Network Average		Network Deficiency (%)	
		2022	2031	2022	2031
Do Nothing	\$ 0	61	35	53	76
\$3.0 million per year	\$ 29,943,000	64	63	49	42
\$4.0 million per year	\$ 39,939,000	65	69	48	34
\$5.0 million per year	\$ 49,941,000	66	78	46	23
\$6.0 million per year	\$ 57,108,000	67	92	44	0
Network Needs	\$ 44,264,000	94	87	3	3

The following observations were made based on the effect of spending levels on current and future predicted network performance and % Deficiency.

- Should the City spend no money over the next 10 years to maintain and rehabilitate the road network as needed, the average PCI will fall from 61 in 2022 to 35 in 2031. The percentage of deficient sections will increase from 53 % in 2022 to 76 % in 2031.
- Spending \$3M/year for the next 10 years will initially maintain the average network PCI at around 64 but will eventually result in a gradual deterioration of the road network to reach an average PCI of 63 in 2031. However, looking at year-by-year results, this level of spending will allow the network average PCI to fall under 60 in 2026 before it goes up again. The Deficiency will decrease from 49 % in 2022 to 42 % by the end of 2031.
- A total spending of \$4M/year is predicted to improve the network average PCI by 1 point initially in 2022 (PCI of 65) and is predicted to reach a PCI of 69 in 2031. The Deficiency is predicted to drop from 48% in 2022 to 34 % in 2031.
- Spending \$5M/year and \$6M/year on the network for the next 10 years is predicted to increase the network average PCI to 78 and 92 in 2031, respectively. These amounts will also decrease the respective Deficiencies to 23 % and zero (0) by the end of 2031.
- Spending approximately \$37M in 2022 (\$44.3M over the next 10 years) will increase the network PCI initially to 94 and will taper down to 87 over the next 10 years. This unlimited funding scenario is predicted to drop the deficiency significantly to 3 % by end of 2031.
- It is worth noting when comparing the results of the \$6M/year spending and the “Network Needs” spending that when the roads are treated earlier in their life, the total cost over the 10-year analysis period will be less compared to when limited funds are available. While this unlimited funding scenario is hypothetical, it goes to show how important it is to stay on top of the road maintenance and rehabilitation work, when possible.

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Executive Summary
January 4, 2022

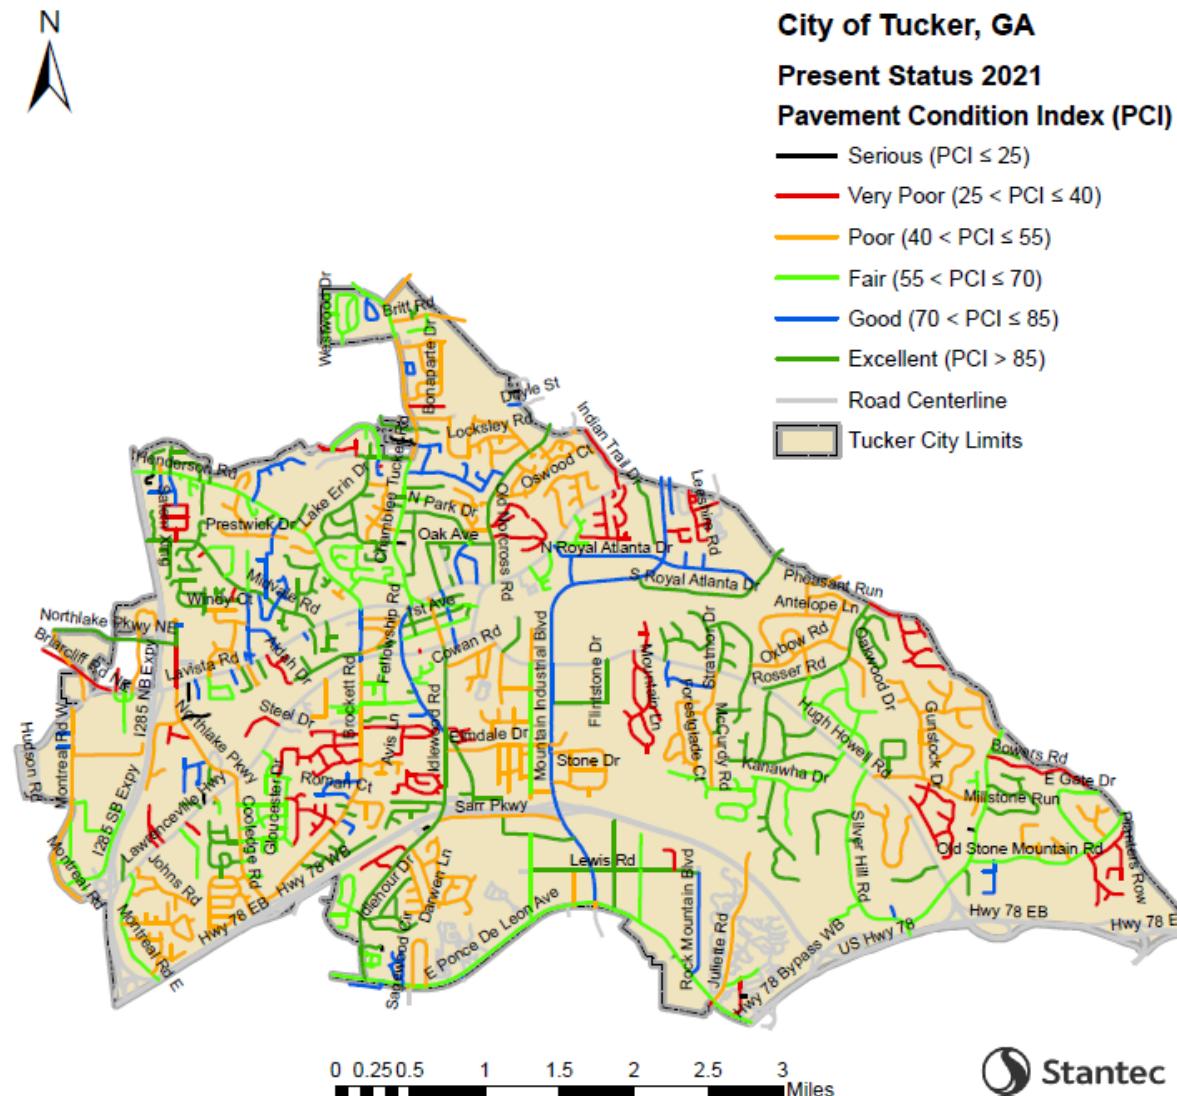

Figure ES.1: City of Tucker 2021 Pavement Condition Index (PCI)

Recommendations

It is recommended that pavement condition assessments be conducted every three years. This will allow the City to track the condition and deterioration of its streets over time using current data. Knowing both the current and trending conditions of the streets provides a true indication about the effectiveness of the City's street maintenance and rehabilitation programs.

Coupled with the condition data, a pavement management system analysis is essential to providing an objective prioritization of work and to determine the impacts of annual street maintenance and rehabilitation programs under current or proposed funding levels. This will enable the City to exercise effective judgment on funding requirements to meet target network condition levels going forward.

1.0 ASSET MANAGEMENT OVERVIEW

Municipalities are stewards of their community's infrastructure. Well-managed infrastructure fosters prosperity, growth, and quality of life for a community's residents, businesses, and visitors.

Most US municipalities are struggling to maintain existing infrastructure under current levy and tax levels. They continue to deal with downloaded responsibilities and, at the same time, face growing needs to maintain and renew aged and decaying infrastructure.

As a result, the subject of asset management has been gaining increasing public awareness. An emphasis is now being placed on not only knowing the true cost of providing services to your customers today, but also understanding what will be required to maintain the services in perpetuity (or as long as they are required), through the use of life cycle costing. In other words, we are moving towards a practice of Sustainable Asset Management.

The following questions are key components to any asset management strategy:

1. What do you have and where is it?
2. What is it worth?
3. What is its condition?
4. What needs to be done?
5. When do you need to do it?
6. How much will it cost?
7. How do you ensure long-term affordability?

By means of implementing a pavement management system and state-of-the-art pavement data collection technology, the goal of Stantec on this assignment was to address these seven questions with respect to the City of Tucker's road network.

1. **What do you have and where is it?**

The City currently maintains approximately 170 centerline miles (368 lane-miles) of roadways as per

2. **What is it worth?**

The valuation of the roads can be expressed by their Net Book Value and Replacement Value. Typically for roads, the Replacement Value is determined using reconstruction costs.

Using an average reconstruction cost of \$50/square yard the replacement value of City streets is approximately \$138 Million.

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Asset Management Overview
January 4, 2022

3. What is its condition?

One key goal of the City was to have the data collection done in such a manner that pavement smoothness and distress is evaluated in a non-subjective way. Stantec accomplished this by utilizing the RT-3000 pavement data collection system. This mobile system incorporates data collection technologies including laser profilers, high definition linescan pavement imagery, Right-of-Way (ROW) imagery and GPS systems.

Ride quality and various pavement distresses were captured and evaluated. A Pavement Condition Index (PCI) was assigned to each block-to-block road segment in the network based on the measured surface distresses and roughness measurements.

The lane-length weighted average PCI for the City of Tucker road network in 2021 was determined to be 64.

Knowing and tracking the current Performance Level allows the City to assess if the road network is deteriorating over time under current funding constraints and/or practices.

4. What needs to be done?

A fundamental pavement management philosophy is to “apply the right treatment to the right road at the right time”.

A well-implemented pavement management system allows the City to realize the benefits of lower-cost treatments such as preventive maintenance and rehabilitation activities, by targeting interventions within the network before more costly replacement and reconstruction alternatives become necessary.

The pavement management software analysis provides the City with the ability to set service level targets and determine the most cost-beneficial pavement maintenance and rehabilitation (M&R) strategies to be applied, at the most optimal time.

The system uses the results of the pavement condition survey, coupled with predictive pavement deterioration curves and decision tree models, to determine appropriate M&R treatments for each pavement management segment in the City’s road network.

5. When do you need to do it?

The RoadMatrix pavement management system uses a cost-benefit approach to identify and prioritize when M&R treatments should be applied to the various road segments throughout the City.

Typically, this will result in selecting road segments that are earlier on in their deterioration trend, thereby attempting to address more roads in “FAIR” to “GOOD” condition. This approach differs significantly from prioritizing roads that are in the “POOR” or “SERIOUS” condition, often referred to as a “worst-first” approach.

By prioritizing roads in the “FAIR” to “GOOD” PCI range, viable treatment options are much less expensive than heavy rehabilitation or reconstruction options for roads that have deteriorated significantly, as illustrated below in Figure 1.1.

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Asset Management Overview

January 4, 2022

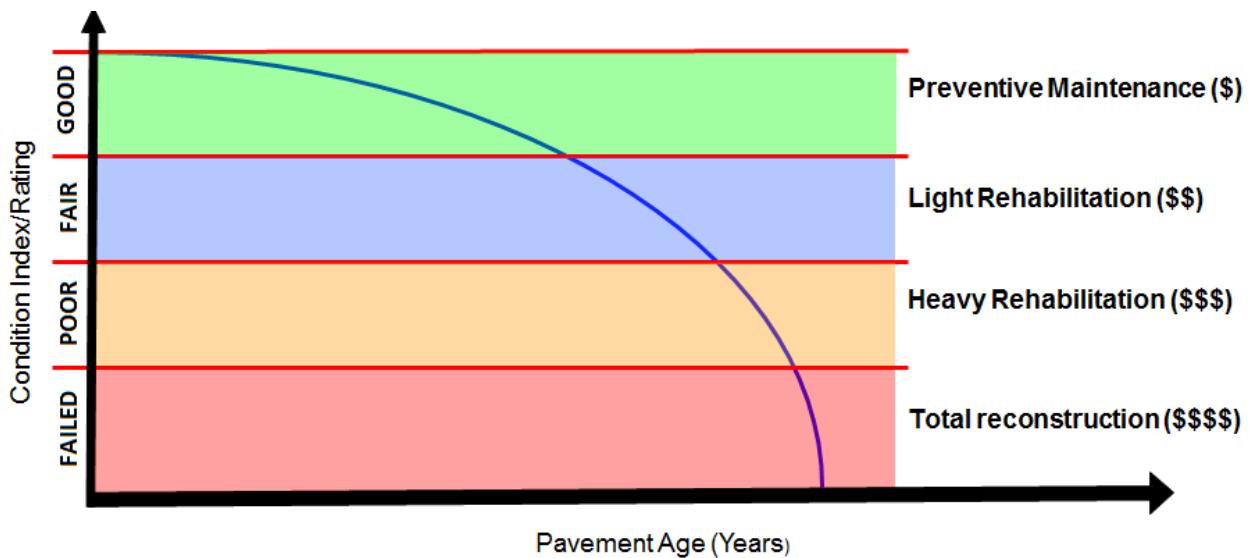

Figure 1.1: Trigger Points for M&R Activities, and their Relative Costs

6. How much will it cost?

Using the pavement management system to analyze various budget scenarios against the maintenance and rehabilitation needs of the road network, a determination can be made as to whether current or anticipated funding is sufficient to maintain the City's roads at an acceptable level of service. The analysis shows that approximately \$37M of rehabilitation is required in 2022, with an additional \$7M required to address the needs of the City's road network over a ten-year time frame.

7. How do you ensure long-term affordability?

A pavement management system provides important information to those staff, managers and City leaders who are ultimately responsible for maintaining or improving the level of service of these assets for the citizens of Tucker. The pavement management system allows the City to continue to monitor the condition of the roads and objectively identifies appropriate treatments at the appropriate time. As a result, the City is better able to quantify the funding needs of the street network and budget accordingly.

2.0 PROJECT OVERVIEW

2.1 BACKGROUND

The City of Tucker (City) is located in DeKalb County near Atlanta, GA. The City is committed to fund infrastructure development to improve the quality of life and economic development for its communities.

The City is responsible for maintaining approximately 170 centerline miles (CL-MI) of road (370 lane miles (LN-M)). A summary of the City's network by functional class is provided below in Table 2.1.

Table 2.1: City of Tucker Road Network Distribution - 2021

Functional Class	No. of Sections	Length (CL-MI)	Length (LN-MI)
Local	1,043	132.7	269.9
Collector	147	18.9	40.1
Minor Arterial	118	13.1	38.5
Major Arterial	26	4.9	19.0
Total Network	1,334	169.6	367.5

The City retained Stantec Consulting Services Inc. (Stantec) in 2021 to collect pavement condition data on all City-maintained streets and provide a present status and network needs prioritization report based on the condition assessment results. A key component of an effective pavement management system is to maintain accurate pavement condition data through regular assessments of the road network, which can then be used within the PMS to recommend appropriate treatment types and timing.

2.2 PROJECT SCOPE AND OBJECTIVES

The 2021 project scope included the following tasks:

- Conduct surface distress and roughness surveys.
- Super-sections updates (See Appendix C for a list of child sections and corresponding super-sections).
- RoadMatrix PMS Parametric updates including treatment types and unit costs.
- Present status analysis and budget analysis.
- Pavement Width measurements.
- PMS Reporting.

The data collected was used to identify the Present Status of the road network in terms of two performance indicators:

- Riding Comfort Index (RCI) - Represents the smoothness (ride quality) of the road.
- Pavement Condition Index (PCI) - Represents the surface condition of the road (cracking, rutting, etc.)

3.0 DATA COLLECTION

A key component of an effective pavement management system is to regularly assess the condition of the road network. These evaluations can be used to assess the performance of the network over time.

3.1 2021 FIELD SURVEY SCOPE

The 2021 field survey scope consisted of the following:

- Collection of Roughness and pavement surface distress data on approximately 175 survey-miles of City - maintained roads. Condition data was collected from June 15 to June 22, 2021.

3.2 DATA COLLECTION METHODOLOGY

Similar to the previous survey cycle in 2017, a Stantec RT-3000 unit equipped with accelerometers, laser sensors, cameras, and inertial global position system (IGPS) was used to conduct the 2021 pavement condition survey for surface distress and roughness. The following subsections summarize the data collection methodologies.

3.2.1 Roughness Data Collection

The roughness (ride quality) of each section was measured using the RT-3000 unit, a specially equipped van with accelerometers and laser sensors mounted to the customized front bumper. This technology was used to measure the longitudinal profile of the pavement surface in each wheel path of the survey travel lane. The profile data was then used to calculate an International Roughness Index (IRI) summarized at 100-ft intervals/stations.

Roughness data was collected using a profiling system certified according to ASTM E950 as a Class I profilometer. The collection of longitudinal profile of roughness data is fully automated. The specialized profile measurement system, mounted on the front bumper of the RT-3000 survey vehicle, employs two sensing devices:

1. A **laser height sensor** that measures the distance between the vehicle and the pavement surface, while the vehicle is traveling at or below the posted speed; and
2. An **accelerometer** that measures the vertical acceleration of the vehicle as it bounces in response to the pavement surface profile.

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Data Collection
January 4, 2022

These two measurements are combined during post-processing, to eliminate the effects of vertical vehicle motion, and thereby define the vertical profile of the pavement surface. The RT-3000 is also equipped with a distance measurement instrument (DMI) to provide a reference measurement of the vehicle as it traverses the road. This measurement provides stationing references for the profile data.

Roughness data is then computed from the above data and expressed in terms of the standard International Roughness Index (IRI) in units of inches/mile. IRI measurements obtained from the RT-3000 system have been correlated with those obtained from other valid profilometers, as well as IRI-calculated values from rod and level, and dipstick surveys.

IRI is measured in each wheel path separately. The data is further converted into a Riding Comfort Index (RCI) within the RoadMatrix PMS for each road section.

3.2.2 Surface Distress Data Collection

Pavement condition is evaluated based on the type, severity, and extent of pavement defects or distresses. Each surface distress is evaluated based on two components:

- **Severity:** defined as '*How bad is the defect?*' and is expressed in terms of the width or degree of wear associated with a particular pavement condition. An example of a severity measurement includes the average width of a crack.
- **Extent:** or '*How much is there?*' is expressed in terms of the quantity of the surface that a particular defect or distress covers. Examples of measures used for extent would include the number and length of transverse cracks, length of longitudinal cracking, or the pavement area affected by an alligator cracking.

The data collection used for this assignment uses the following sub-systems for the distress data collection:

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Data Collection
January 4, 2022

3.2.2.1 Laser Crack Measuring System (LCMS)

Instead of acquiring a digital image of an area in the manner of a conventional camera, Stantec's RT-3000 equipment collected the physical pavement surface defects at posted speeds, utilizing our RT-3000's Laser Crack Measuring systems (LCMS) and downward imaging technology. Stantec's LCMS uses laser line projectors, high speed cameras, and advanced optics, to acquire high resolution 3D profiles of the road. This unique 3D vision technology allows for automatic pavement condition assessments of asphalt, porous asphalt, chip seal, and concrete surfaces.

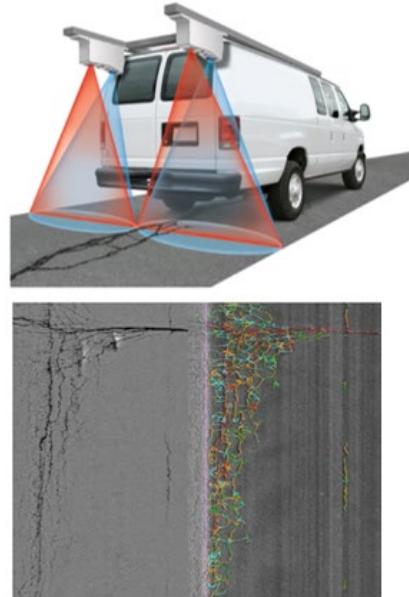

The LCMS acquires both 3D and 2D image data of the road surface with 0.04 inch (1 mm) resolution, over a 13-foot lane width, at survey speeds up to 60 mph. This data collection technique did not impact road users as the vehicle travels at posted speeds.

The pavement imagery captured by the RT-3000 was subsequently post-processed through Stantec's Imaging Workstation. This system was specifically designed for pavement surface analysis, using both the 3D and 2D pavement imagery components of the LCMS, as well as the collected ROW images. The Imaging Workstation expedites the distress rating process with built-in tools and synchronized images, from multiple cameras. The software was used to detect and analyze cracks, lane markings, ruts, macro-texture, patches, raveling, and potholes. As a result, each distress was measured, not estimated, and tagged with a linear reference and corresponding GPS coordinates. The distress data was collected continuously and summarized at 100-foot intervals.

Some pavement surface deficiencies were collected visually utilizing a special keyboard within the RT-3000. Due to the nature of these surface deficiencies, we found that such deficiencies (e.g., Raveling) are captured more accurately using visual means.

3.2.2.2 Laser - Transverse Profile / Rutting Data Collection

Rutting data is simultaneously collected along with surface distress and roughness data. The RT-3000 measures transverse profile and rut depths, using a minimum of five high-precision, laser-based height-measuring sensors. The two lasers on either end of the rut bar are angled, to provide a full width transverse profile across the traveled lane. From the laser measurements, the average rut depths are computed for each wheel path for upload to RoadMatrix. Calculations of rut depth simulate the straight edge method and are made in accordance with ASTM E 1703E/1703M-95 "Standard Test Method for Measuring Rut Depth of Pavement Surface Using a Straightedge". The RT-3000 unit was operated at a minimum speed of 15 miles per hour, to ensure reliable profile data was being collected.

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Data Collection
January 4, 2022

Distress Rating Protocols

The collected surface distresses were rated according to the ASTM D6433 Standards. A summary of the distresses included in the ASTM D6433 Standards are provided below in Table 3.1.

Table 3.1: ASTM D6433 Distress Types

Flexible Pavements	Rigid Pavements
<ul style="list-style-type: none">• Alligator Cracking• Bleeding• Block Cracking• Bumps and Sags• Corrugation• Depression• Edge Cracking• Jt. Reflection Cracking• Lane/Shoulder Drop Off• Long and Trans Cracking• Patching• Polished Aggregate• Potholes• Rutting• Shoving• Slippage Cracking• Swell• Weathering/Raveling	<ul style="list-style-type: none">• Blow Up/ Buckling• Corner Break• Divided Slab• Durability Crack• Faulting• Joint Seal• Lane/Shoulder Drop Off• Linear Cracking• Patching (Large)• Patching (Small)• Polished Aggregate• Popouts• Pumping• Scaling• Shrinkage Crack• Spalling Corner• Spalling Joint

The survey was generally conducted in the outer-most lane of each road segment. Road sections with four or more traffic lanes and/or divided road sections, if any, were tested in both directions of travel.

4.0 ANALYSIS

4.1 ROUGHNESS – RIDE COMFORT INDEX (RCI) ANALYSIS

One of the primary operating characteristics of a road, from the user's perspective, is the rideability, or the Riding Comfort Index (RCI). The RCI represents the traveling public's opinion of the pavement's smoothness and, hence, the quality of service it provides. Rating panels composed of local drivers/citizens were used at the onset of the initial implementation of pavement management systems, to calibrate the public's perspective of ride quality against the roughness measurements obtained from a profiler. The RT-3000 unit was used to determine the longitudinal profile of the pavement surface, reported as an IRI value.

The RCI Analysis is used to calculate the sectional RCI from detailed field collected measurements (IRI). The following model is used to convert IRI measurements to RCI values:

$$RCI = 10 * (26.67 - 3.82 * \ln(IRI))$$

where, IRI is the International Roughness Index from the longitudinal profile of the average of the left and right wheel paths summarized at 100-ft intervals, at a minimum speed of 15 miles per hour.

The RCI value for each section ranges from zero (0) to 100, where 100 is indicative of an extremely smooth pavement and an index of zero is indicative of an extremely rough/bumpy pavement.

Figure 4.1 below illustrates the relationship between RCI and IRI.

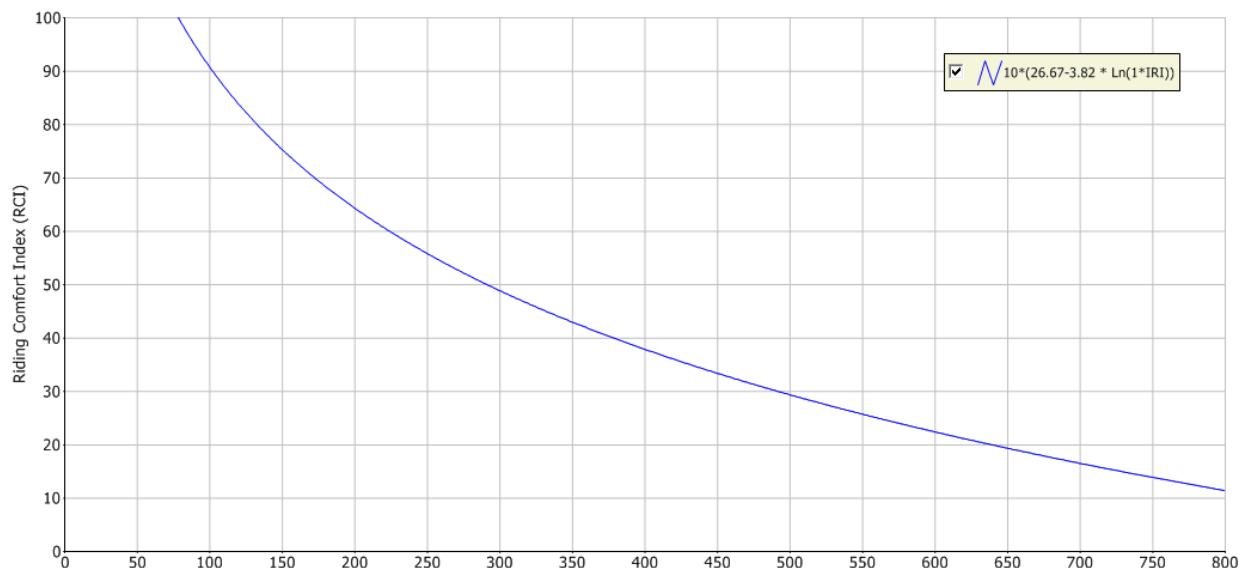

Figure 4.1: IRI vs. RCI Model

January 4, 2022

4.2 PAVEMENT CONDITION INDEX (PCI) ANALYSIS

The RT-3000 surface distress survey provided a rating of the severity and extent of each of 19 ASTM asphalt pavement distresses for each road segment in the network. A Pavement Condition Index (PCI) score was then computed using the industry standard ASTM PCI model.

The ASTM PCI model uses a Distress Deduct methodology to compute a PCI score based on all the observed distresses. In general, the deduct model involves starting a road segment at PCI=100 assuming no distresses, and then deducting PCI points based on the severity and amount of each distress type observed. The amount of deducts that each observed distress type has on the PCI score is also weighted based on their relative influence on the overall condition and performance of a road.

For example, structural type defects, such as Alligator cracking, will have a greater influence (i.e., more deducts) on the PCI score as these defects indicate the that the road is losing the ability to support the current traffic, and there is greater potential for the road to deteriorate rapidly.

The following previously-captured images on various streets in the City of Tucker provide a visual representation of varying levels of the Pavement Condition Index.

PCI=86-100 (Excellent): E Ponce De Leon Ave

4.3 PERFORMANCE PREDICTION MODELING

Due to traffic loading and the elements, the pavement PCI ratings typically decrease over time. In order to estimate the future condition and rehabilitation requirements of a pavement network, it is necessary to model the deterioration of PCI. The rate of decrease of PCI depends on many factors, but it can be demonstrated that the principal factors affecting deterioration of pavements are the traffic loading conditions, the properties and thickness of the pavement structure layers, and the subgrade soil properties.

As a result, the factors used to model pavement performance in RoadMatrix are: equivalent granular thickness (3 levels); subgrade strength (2 levels), and traffic volume (3 levels). This results in 18 possible classes of pavements, and each of the 18 pavement classes is assigned a performance curve as shown below in Figure 4.8.

Future pavement data collection activities will allow for the tracking of PCI over time. This will assist in the development of pavement performance prediction models specific for the City of Tucker. This effort typically requires at least 3 survey cycles to have the minimum data points needed to develop a curve.

4.4 DECISION TREES

“Decision Trees” are a means of automating the selection of appropriate maintenance and rehabilitation (M&R) alternatives to be performed on any given road segment based on its performance and other factors. Furthermore, decision trees are used to identify the minimum acceptable PCI for a road segment before an M&R treatment is triggered.

The RoadMatrix decision trees offer the flexibility to reflect the City’s current M&R practice but also sound pavement management principles.

The decision trees were updated in 2021 based on input received from the City. The decision tree shown below in Figure 4.9 is an example of a decision tree that was developed for the City’s Local roads with flexible pavement type. All decision trees are illustrated in Appendix B.

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Analysis
January 4, 2022

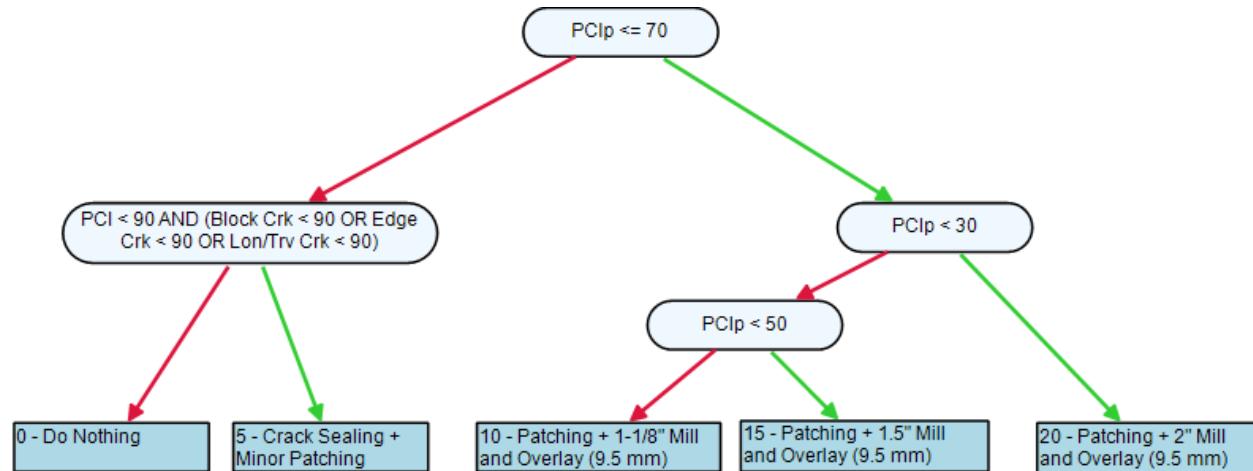

Figure 4.9: Tucker Decision Tree for Local Road Class – Flexible Pavement Type

The decision tree process involves analyzing every road segment by assessing the criteria defined in the NODES of the trees and following the appropriate BRANCH until a specific treatment is selected.

As can be seen in the decision tree above, pavement condition criteria were initially established by looking at $\text{PCI} \leq 70$ in the top NODE of the tree. If this NODE criterion was met for a pavement section, the process would follow to the next NODE criteria along the right (GREEN) BRANCH.

If the decision criteria displayed in the NODE was not met, then the process would follow the left (RED) BRANCH. This process would continue until all criteria were analyzed and resulted in a specific treatment selection at the bottom of the tree for each road segment in the network.

4.5 MAINTENANCE AND REHABILITATION (M&R) TREATMENTS

In consultation with City staff, the following maintenance and rehabilitation (M&R) treatment options shown in Table 4.1 were implemented for this 2021 analysis. Treatment unit costs have been also provided by the City except for the "Crack Sealing + Minor Patching" treatment where the cost was estimated by Stantec based on input from the City.

Table 4.1: Rehabilitation Alternatives

Code	Treatment	Unit Cost (\$/ft ²)	Base Year	EGT Increase	RCI Increase	PCI Increase	RCI Max	PCI Max
0	Do Nothing	0.00	2021	0	0	0	80	100
5	Crack Sealing + Minor Patching	0.50	2021	0	5	10	80	100
10	Patching + 1-1/8" Mill and Overlay (9.5 mm)	2.00	2021	0.6	25	70	80	100
15	Patching + 1.5" Mill and Overlay (9.5 mm)	2.25	2021	0	35	80	80	100
20	Patching + 2" Mill and Overlay (9.5 mm)	2.50	2021	1.0	45	100	80	100
25	Patching + 2" Mill and Overlay (12.5 mm)	2.75	2021	1.0	45	100	80	100
30	Patching + 3" Mill and Overlay (12.5 mm)	3.00	2021	1.5	70	100	80	100
35	FDR - 12" CTB + 4" HMA	5.70	2021	0	80	100	80	100

Where:

Unit Cost: Unit rates for each treatment were determined using recent tender pricing and industry averages. A 3% annual inflation rate was applied to determine costs in future years.

EGT Increase: This field identifies the increase in Equivalent Granular Thickness (EGT) the treatment would add to the section's pavement structure. As noted earlier, this may result in the treatment putting the pavement section on a slower deteriorating curve going forward and thus positively impact the cost-benefit of the treatment.

RCI/PCI Increase: These fields identify what the expected increase in the Ride Comfort Index and Pavement Condition Index would be to roads after the treatment is applied.

RCI/PCI Max: These fields define the maximum limit, the cap, of the RCI and PCI scores after treatment benefits are applied.

In addition, the "Crack Sealing + Minor Patching" treatment was associated with a one-year hold on PCI and RCI performance. This means that the PCI and RCI performance will not deteriorate for one year after the treatment is applied.

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Analysis
January 4, 2022

4.6 NEED YEAR AND % DEFICIENCY

For any given pavement management section, the year in which the PCI for the section is predicted to fall to, or below, a Minimum Acceptable PCI level is defined as the **Minimum Acceptable Need Year**. Sections falling below the trigger are also labelled as **Deficient**.

The minimum Acceptable PCI levels are defined for each combination of Functional Class and Pavement Type.

The Minimum Acceptable PCI was set to the thresholds shown below in Table 4.2.

Table 4.2: Minimum Acceptable PCI

Functional Class			
Major Arterial	Minor Arterial	Collector	Local
PCI=70	PCI=65	PCI=60	PCI=55

4.7 PRIORITY PROGRAMMING ANALYSIS

Using the decision trees to identify technically feasible strategies, and a life-cycle economic analysis to assess the relative effectiveness of each strategy; a ten-year rehabilitation priority program of road segments was developed. This rehabilitation program maximized the benefit of each dollar spent while keeping within specified budget constraints.

4.7.1 Cost Effectiveness Analysis

As previously discussed, the decision tree analysis determines appropriate rehabilitation alternatives based on pre-defined criteria (i.e., pavement condition, geometry, traffic volumes, etc.). Using these rehab strategies, their unit costs and the performance prediction models, a life-cycle economic analysis was performed to determine rehabilitation strategies depending on the amount of dedicated funds.

The “cost-benefit” concept can be explained using the illustration in Figure 4.10 below. The “Do Nothing” performance curve represents the current deterioration model for any given pavement segment, with no maintenance or rehabilitation. The “After Rehabilitation” performance curve predicts how the section will deteriorate after the selected treatment is applied. The area between the two curves is the calculated “benefit” of the treatment.

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Analysis

January 4, 2022

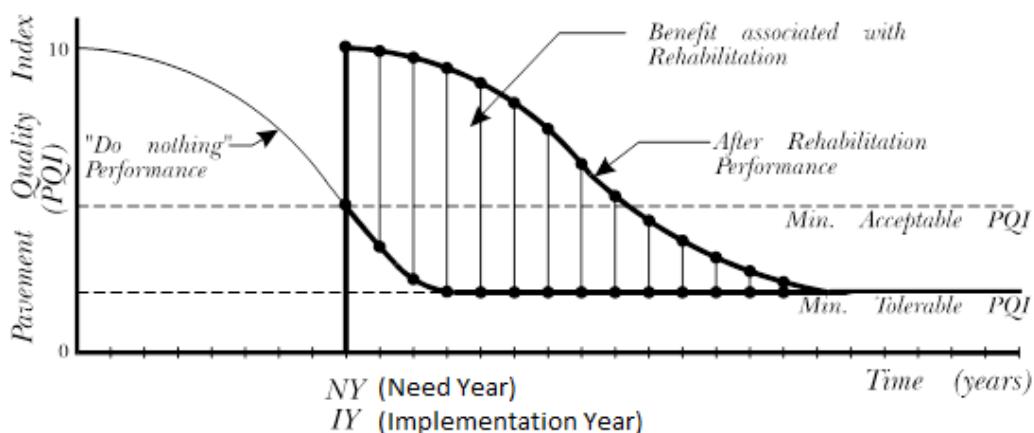

Figure 4.10: Cost-Benefit Concept

The cost of the treatment is determined based on the defined unit rate and the area of the road segment receiving the treatment. Yearly inflation is also factored in over the ten-year analysis period. The pavement area of each pavement section has been calculated using the updated pavement width information measured in 2021.

4.7.2 Priority Programming

The **Priority Programming** analysis ranks every segment in the network based on its Cost Effectiveness score. The available funding is applied to the segment rankings (based on worst to best condition) and the pavement management system selects the most cost-effective segments and their associated treatments until the available budget is exhausted.

All segments that were not selected in the first year are then re-analyzed for their cost effectiveness in the second year. The same ranking and budget consumption process is done to select segments for the second year of the program.

This process is repeated over a ten-year analysis period. The result is a prioritized list of road segments and their associated treatments that should be considered as part of the City's actual rehabilitation programs.

As per the City's input, the needs and budget analyses were completed using a Worst-First approach. This allows for the selection of roads that are in the worst condition first before moving to roads in better condition depending on funds availability. While not the most cost-effective approach, this approach can deal with roads in bad condition to ensure the safety of road users. The City should be considering moving to the "Cost-Effectiveness" analysis approach that puts more emphasis on keeping good roads in good condition which typically results in the best "bang for the buck" over the long term.

5.0 ANALYSIS RESULTS

5.1 PRESENT STATUS ANALYSIS

The following subsections discuss and summarize the condition of the City of Tucker's road network based on the 2021 pavement condition survey results.

5.1.1 Ride Comfort Index (RCI) Analysis

A plot showing the distribution of RCI values, weighted by lane miles, is shown below Figure 5.1. A list of RCI results per super-section (or per section when it does not belong to a super-section) is listed in Appendix C.

The plot shows a mean RCI of 64.1. An RCI value in the range of 60 to 100 is indicative of a pavement with "GOOD" ride quality characteristics. Results indicate that 63 % of the network (approximately 232 lane miles) falls into the "GOOD" ride quality category. There are approximately 132 lane miles (36 %) of the network that fall within the "FAIR" ride quality category, and approximately 6 lane miles (1.5 %) of road that provide "POOR" ride quality.

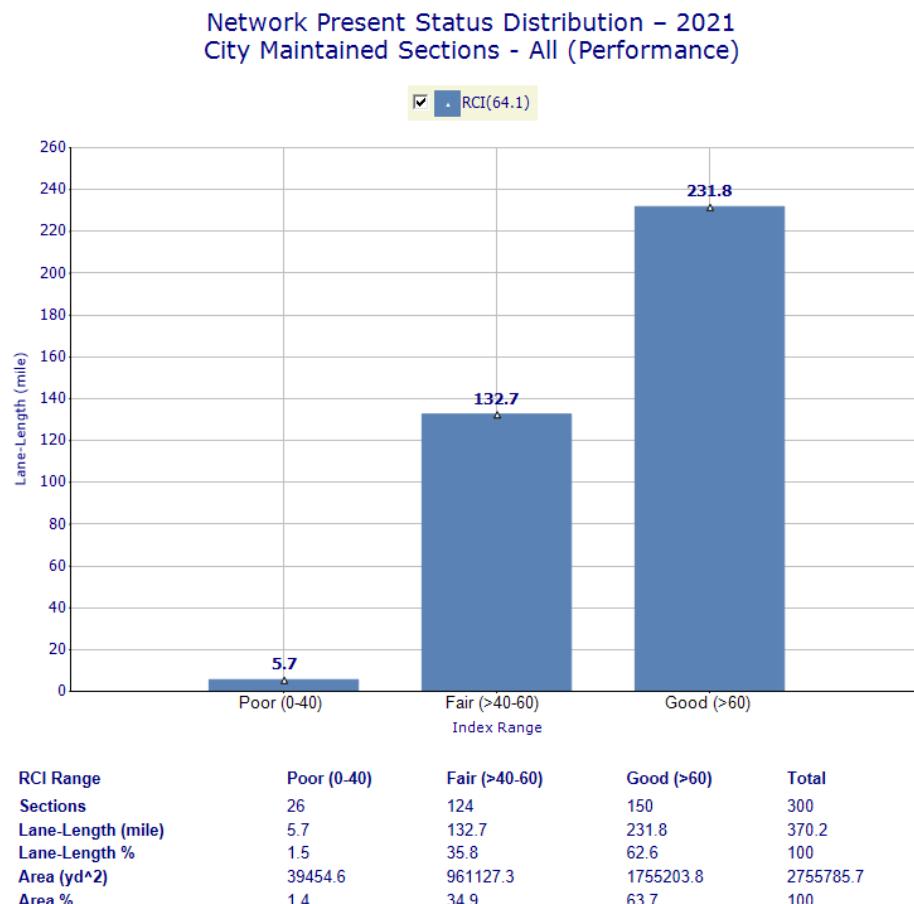

Figure 5.1: 2021 RCI Distribution for Tucker Streets

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Analysis Results
January 4, 2022

5.1.2 Pavement Condition Index (PCI) Analysis

The Pavement Condition Index (PCI) describes the surface condition of the road. PCI ratings of a road can be described using the PCI condition categories shown below in Table 5.1.

Table 5.1: PCI Condition Category

PCI Range	Condition Category
86 - 100	Excellent
71 - 85	Good
56 - 70	Fair
41 - 55	Poor
26 - 40	Very Poor
0 - 25	Serious

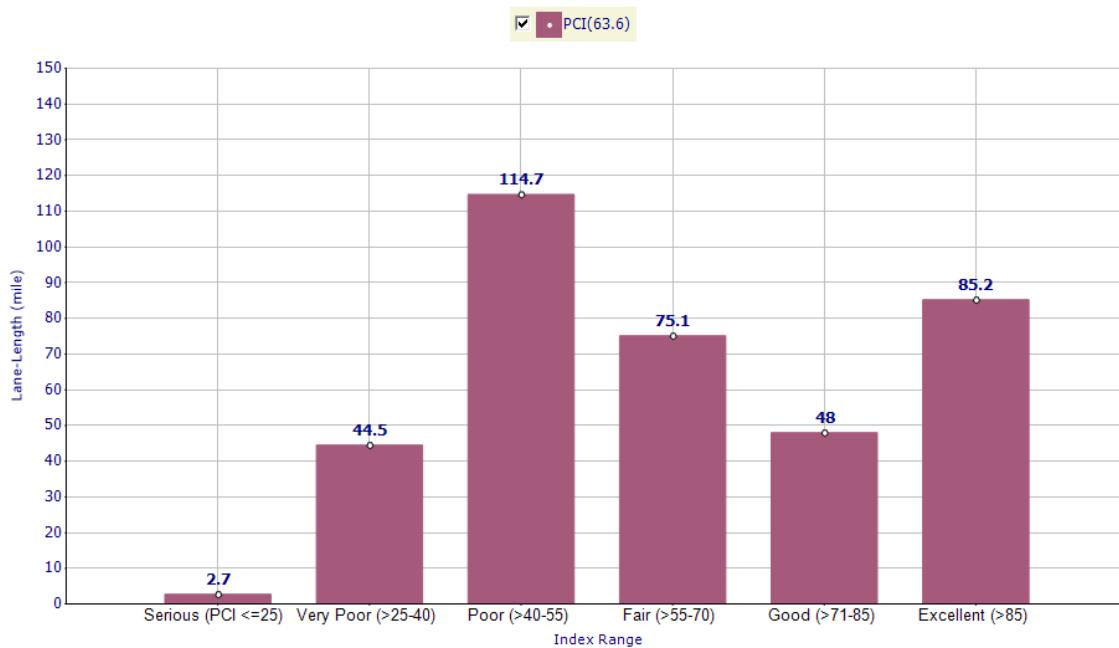

A graph showing the distribution of 2021 PCI values, weighted by lane miles, is shown below in Figure 5.2. A list of PCI results per super-section (or per section when it does not belong to a super-section) is listed in Appendix C.

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Analysis Results
January 4, 2022

Network Present Status Distribution – 2021
City Maintained Sections - All (Performance)

PCI Range	Serious (PCI <=25)	Very Poor (>25-40)	Poor (>40-55)	Fair (>55-70)	Good (>71-85)	Excellent (>85)	Total
Sections	11	37	68	51	38	95	300
Lane-Length (mile)	2.7	44.5	114.7	75.1	48	85.2	370.2
Lane-Length %	0.7	12	31	20.3	13	23	100
Area (yd^2)	19069.7	314908.2	863903.3	575677	353845.6	628381.9	2755785.7
Area %	0.7	11.4	31.3	20.9	12.8	22.8	100

Figure 5.2: 2021 PCI Distribution for Tucker Streets

It is worth noting that the PCI results presented herein include the added benefits that resulted from doing rehabilitation work on approximately 1.7 centerline miles of roads within the City after the condition data was collected.

The average network PCI of 63.6 indicates that, from a pavement surface distress perspective, the network average performance is currently rated as a “FAIR” condition.

Approximately 115 lane-miles, or 31 % of the network falls within the “POOR” PCI category. Approximately 75 lane-miles, or 20 % of the network falls within the “FAIR” condition category, and approximately 133 lane-miles or 36 % of the network falls within the “GOOD” or “EXCELLENT” PCI category.

The PCI distribution above also shows that approximately 2.7 lane-miles, or <1 % of the network, have a PCI score less than 25, which indicates that a significant number of distresses exist on these sections and that these roads are in “SERIOUS” condition. Approximately 45 lane-miles, or 12 % of roads are in a “VERY POOR” condition. These roads require a heavy treatment to improve their condition.

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Analysis Results
January 4, 2022

The information in Table 5.2 below indicates that approximately 47 % of the network (172.3 lane-miles) is deficient, i.e., roads with PCI scores less than the predefined Acceptable PCI thresholds for their functional class.

Table 5.2: 2021 PCI Distribution for the City of Tucker*

PCI Range	Overall Performance	LN-mile	% of All Sections
PCI \leq PCI _{min}	Deficient	172.3	46.9%
PCI > PCI _{min}	Acceptable	195.2	53.1%

*PCI_{min} = 70 for Major Arterial, 65 for Minor Arterial, 60 for Collector and 55 for Local

When comparing the % deficiency results by functional class, the results below in Table 5.3 indicate that Minor Arterials have the highest percentage of deficient roads (76.4 %) followed by Major Arterials (49.5 %), Local roads (44.8 %), and lastly the Collector roads with the lowest Deficiency of 31.7 %.

A summary of the lane-length weighted PCI by functional class is also provided below in Table 5.3. The results indicate that Major Arterial roads have the highest average PCI score of 72 followed closely by Collector roads with an average PCI of 71. The Local roads show an average PCI of 63 and the Minor Arterial roads show an average PCI of 56, the lowest amongst all functional classes.

Table 5.3: PCI Distribution for the City of Tucker by Functional Class*

Functional Class	PCI Weighted Average	PCI Range	Performance Rating	LN-mile	% of Sections
Local	63	PCI \leq 55	Deficient	120.8	44.8
		PCI > 55	Acceptable	149.1	55.2
Collector	71	PCI \leq 60	Deficient	12.7	31.7
		PCI > 60	Acceptable	27.4	68.3
Minor Arterial	56	PCI \leq 65	Deficient	29.4	76.4
		PCI > 65	Acceptable	9.1	23.6
Major Arterial	72	PCI \leq 70	Deficient	9.4	49.5
		PCI > 70	Acceptable	9.6	50.5

*PCI_{min} = 70 for Major Arterial, 65 for Minor Arterial, 60 for Collector and 55 for Local

Analysis Results
January 4, 2022

5.2 NEEDS ANALYSIS

As previously noted, the year in which the PCI of a pavement section decreases to, or below, the Minimum Acceptable PCI level is defined as the Minimum Acceptable Need Year of that section. The Minimum Acceptable Need Year distribution for the City of Tucker's pavement network is presented in Figure 5.3.

The distribution shows that approximately 178 lane-miles or 48 % of the network is currently below the minimum acceptable level and in need of some form of rehabilitation work as of 2021. Over the next five years, including 2021, it is predicted that approximately 250.8 lane-miles or 67.8 % of the network will fall to, or below, the acceptable level if no rehabilitation is done. Over the next ten years, it is predicted that 276.1 lane miles or 74.7 % of the network will fall below minimum acceptable levels.

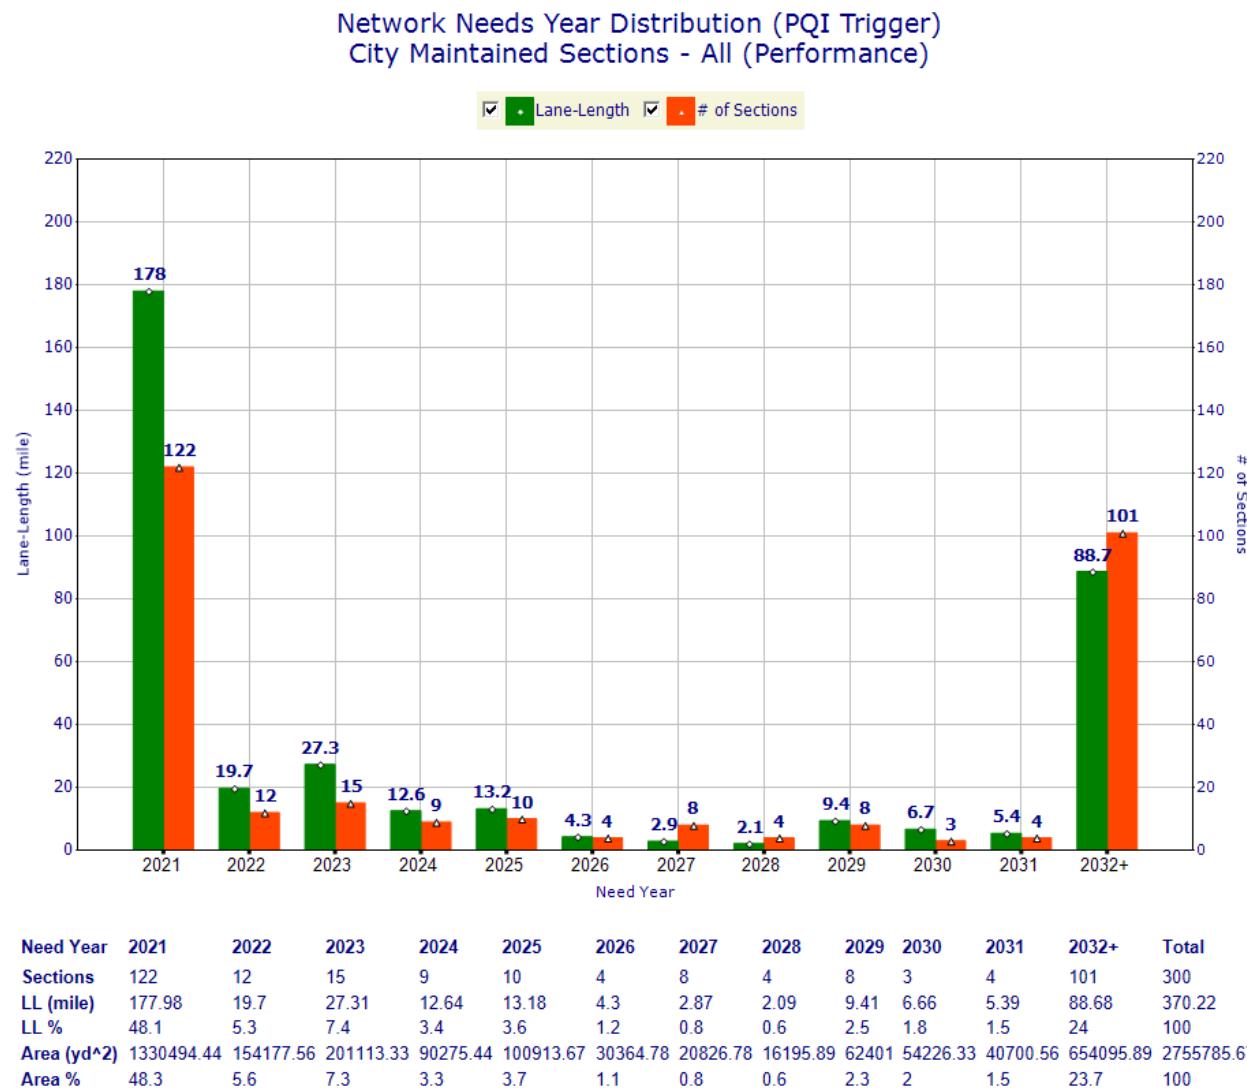

Figure 5.3: Network Need Year Distribution

5.3 BUDGET IMPACTS ON NETWORK PCI

The impact that the various budget scenarios have on network condition have been analyzed for the following six budget scenarios:

1. Do Nothing
2. Annual Budget=\$3.0 Million Annually
3. Annual Budget=\$4.0 Million Annually
4. Annual Budget=\$5.0 Million Annually
5. Annual Budget=\$6.0 Million Annually
6. Network Needs Budget (Unlimited Funding)

5.3.1 Budget Analysis Results Summary

A summary of the budget analysis results is presented below in Table 5.4. The summary shows the total cost for each budget scenario over the 10-year analysis period, as well as the predicted network lane-length average PCI and network % deficiency at the end of 2022 and 2031.

Table 5.4: Budget Analysis Results Summary

Budget	Total Cost (10 Years)	PCI Network Average		Network Deficiency (%)	
		2022	2031	2022	2031
Do Nothing	\$ 0	61	35	53	76
\$3.0 million per year	\$ 29,943,000	64	63	49	42
\$4.0 million per year	\$ 39,939,000	65	69	48	34
\$5.0 million per year	\$ 49,941,000	66	78	46	23
\$6.0 million per year	\$ 57,108,000	67	92	44	0
Network Needs	\$ 44,264,000	94	87	3	3

The following observations were made based on the effect of spending levels on current and future predicted network performance and % deficiency.

- Should the City spend no money over the next 10 years to maintain and rehabilitate the road network as needed, the average PCI will fall from 61 in 2022 to 35 in 2031. The percentage of deficient sections will increase from 53 % in 2022 to 76 % in 2031.
- Spending \$3M/year for the next 10 years will initially maintain the average network PCI at around 64 but will eventually result in a gradual deterioration of the road network to reach an average PCI of 63 in 2031. However, looking at year-by-year results, this level of spending will allow the network average PCI to fall under 60 in 2026 before it goes up again. The Deficiency will decrease from 49 % in 2022 to 42 % by the end of 2031.

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Analysis Results
January 4, 2022

- A total spending of \$4M/year is predicted to improve the network average PCI by 1 point initially in 2022 (PCI of 65) and is predicted to reach a PCI of 69 in 2031. The Deficiency is predicted to drop from 48% in 2022 to 34 % in 2031.
- Spending \$5M/year and \$6M/year on the network for the next 10 years is predicted to increase the network average PCI to 78 and 92 in 2031, respectively. These amounts will also decrease the respective Deficiencies to 23 % and zero (0) by the end of 2031.
- Spending approximately \$37M in 2022 (\$44.3M over the next 10 years) will increase the network PCI initially to 94 and will taper down to 87 over the next 10 years. This unlimited funding scenario is predicted to drop the deficiency significantly to 3 % by end of 2031.
- It is worth noting when comparing the results of the \$6M/year spending and the “Network Needs” spending that when the roads are treated earlier in their life, the total cost over the 10-year analysis period will be less compared to when limited funds are available. While this unlimited funding scenario is hypothetical, it goes to show how important it is to stay on top of the road maintenance and rehabilitation work, when possible.

5.3.2 Budget Analysis Results for Individual Scenarios

The annual results of the individual budget analyses are presented below in Table 5.5 through Table 5.10. The presented budgets are rounded to the nearest \$1,000.

Table 5.5 below provides a summary of the predicted network performance and % deficiency should no work be completed over the next 10 years. The results indicate that the network average PCI will drop from 61 in 2022 to 35 by the end of 2031. Similarly, the predicted % deficiency will increase from 53 % network deficiency to 76 % network deficiency in 2031.

Table 5.5: “Do Nothing” Budget Scenario

Year	Budget	Predicted PCI	Predicted Deficiency %
2022	\$ 0	61	53
2023	\$ 0	58	61
2024	\$ 0	55	64
2025	\$ 0	52	68
2026	\$ 0	49	69
2027	\$ 0	46	70
2028	\$ 0	43	70
2029	\$ 0	40	73
2030	\$ 0	37	75
2031	\$ 0	35	76
Total	\$ 0		

Table 5.6 below provides a summary of the impact that a \$3.0 Million annual funding level may have on the road network over the next ten years. This scenario predicts that the network PCI will remain similar to 2021 performance in 2022 but will start decreasing afterwards to reach a predicted PCI of 63 in 2031. The predicted deficiency will be within the 42-56 % range over the next 10 years. The results indicate that the \$3.0M/Year funding level is insufficient to maintain the current network average PCI of 64.

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Analysis Results
January 4, 2022

Table 5.6: “\$3.0 Million Annual” Budget Scenario

Year	Budget	Predicted PCI	Predicted Deficiency %
2022	\$2,998,000	64	49
2023	\$2,999,000	63	54
2024	\$2,997,000	62	55
2025	\$2,998,000	61	56
2026	\$2,995,000	60	55
2027	\$2,995,000	60	52
2028	\$2,996,000	61	48
2029	\$2,992,000	62	46
2030	\$2,975,000	63	44
2031	\$2,998,000	63	42
Total	\$29,943,000		

Table 5.7 below provides a summary of the impact that a \$4.0 Million annual funding level may have on the road network over the next ten years. This scenario predicts that the network PCI will improve by approximately 1 point in the first year and will continue to improve until it reaches a predicted PCI of 69 in 2031. The network deficiency will be reduced over the 10-year analysis period to reach approximately 34 % in 2031. The results indicate that the \$4.0M/Year funding level is sufficient to maintain and improve the current network average PCI of 64.

Table 5.7: “\$4.0 Million Annual” Budget Scenario

Year	Budget	Predicted PCI	Predicted Deficiency %
2022	\$4,000,000	65	48
2023	\$3,999,000	66	49
2024	\$3,999,000	65	50
2025	\$3,994,000	65	50

Analysis Results
January 4, 2022

Table 5.8 below provides a summary of the impact that a \$5.0 Million annual funding level may have on the road network over the next ten years. This scenario predicts that the network PCI will improve by 2 points in the first year and will continue to improve until it reaches a predicted PCI of 78 in 2031. The network deficiency will be reduced over the 10-year analysis period to reach approximately 23 % in 2030.

Table 5.8: “\$5.0 Million Annual” Budget Scenario

Year	Budget	Predicted PCI	Predicted Deficiency %
2022	\$4,999,000	66	46
2023	\$4,999,000	68	47
2024	\$4,997,000	70	44
2025	\$4,998,000	71	42
2026	\$4,996,000	72	37
2027	\$4,997,000	73	34
2028	\$4,995,000	74	30
2029	\$4,989,000	75	28
2030	\$4,997,000	77	24
2031	\$4,973,000	78	23
Total	\$49,941,000		

Table 5.9 below provides a summary of the impact that a \$6.0 Million annual funding level may have on the road network over the next ten years. Similar to the \$5.0 M annual funding results, this scenario predicts that the network PCI will improve by 3 points in the first year and will continue to improve until it reaches a predicted PCI of 92 in 2031. The network deficiency will be eliminated by the end of 2031.

Table 5.9: “\$6.0 Million Annual” Budget Scenario

Year	Budget	Predicted PCI	Predicted Deficiency %
2022	\$5,999,000	67	44
2023	\$5,998,000	70	43

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Analysis Results
January 4, 2022

Table 5.10 below provides a summary of the impact that the unlimited funding (Needs Driven analysis) may have on the road network over the next ten years. The results indicate that approximately \$37.5M will be required to deal with all of the backlog in the first year of the analysis. The network PCI is expected to increase to 94 in the first year and will stay between 87 and 95 for the rest of the analysis period. The network deficiency will be range between 0 and 3 % over the analysis period.

Table 5.10: “Needs Driven” Budget Scenario

Year	Budget	Predicted PCI	Predicted Deficiency %

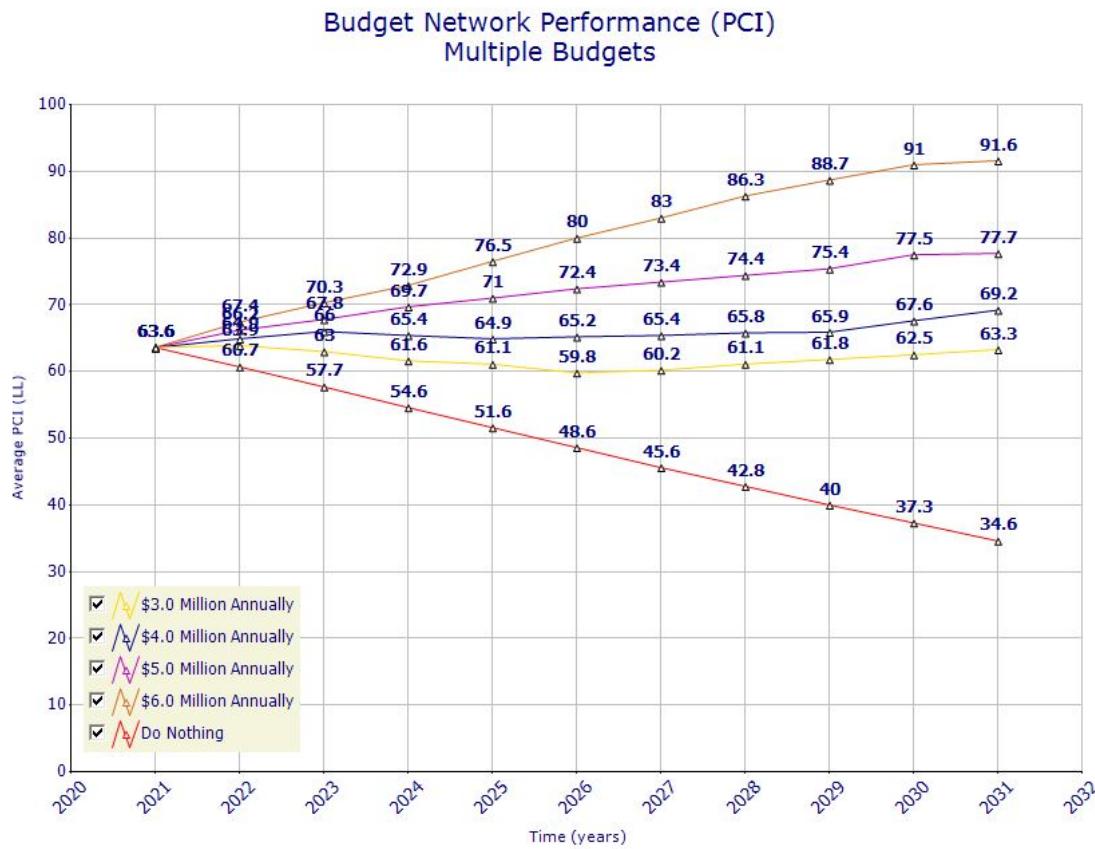

Figure 5.4: Various Budget Scenario Impacts on Predicted Network PCI

5.4 BUDGET RECOMMENDED REHABILITATIONS

The ten-year M&R work programs for the \$3.0M, \$4.0M, and \$5.0M analysis scenarios are provided in Appendix E. The ten-year M&R treatment location Maps for each budget scenario are presented in Appendix C. The work programs are sorted first by Implementation Year and then by Street Name.

Figure 5.5 through Figure 5.7 below illustrate the distribution of the M&R treatments for each analysis scenario, in terms of treatment types and the number of road sections recommended for each treatment type and implementation year. These figures cover the first five years only (2022-2026).

6.0 SUMMARY OF RESULTS

A summary of the pavement investigation results based on the pavement condition assessment completed in 2021 for the City of Tucker and the various needs and budget scenario analyses that were completed as part of this project are provided in the sub-sections below:

6.1 PRESENT STATUS

- The majority of the road network is in “FAIR” condition as noted by the network lane-length weighted PCI of 64
- Approximately 115 lane-miles, or 31 % of the network falls within the “POOR” PCI category. Approximately 75 lane-miles, or 20 % of the network falls within the “FAIR” condition category, and approximately 133 lane-miles or 36 % of the network falls within the “GOOD” or “EXCELLENT” PCI category.
- Approximately 2.7 lane-miles, or <1 % of the network, have a PCI score less than 25, which indicates that a significant number of distresses exists on these sections and the roads are in “SERIOUS” condition
- A summary of the lane-length weighted PCI by functional class indicate that Major Arterial roads have the highest average PCI score of 72 followed closely by Collector roads with an average PCI of 71. The Local roads show an average PCI of 63 and the Minor Arterial roads show an average PCI of 56, the lowest amongst all functional classes.
- The ride quality results indicate a network average RCI of 64. This RCI value suggest that “GOOD” ride quality characteristics at the network level.
- The ride quality results also indicate that 63 % of the network (approximately 232 lane miles) falls into the “GOOD” ride quality category. There are approximately 132 lane miles (36 %) of the network that fall within the “FAIR” ride quality category, and approximately 6 lane miles (1.5 %) of road that provide “POOR” ride quality.
- In terms of network deficiency, approximately 47 % of the network (172 lane miles) is deficient, i.e., road section’s PCI have fallen below the acceptable PCI thresholds (70 for Major Arterials, 65 for Minor Arterials, 60 for Collectors and 55 for Locals).
- The % deficiency results by functional class indicate that the Minor Arterials have the highest percentage of deficient roads (76.4 %) followed by Major Arterials (49.5 %), Local roads (44.8 %), and lastly the Collector roads with the lowest % Deficiency of 31.7 %.

6.2 BUDGET ANALYSIS RESULTS

The following observations were made based on the effect of spending levels on current and future predicted network performance and % deficiency.

- Should the City spend no money over the next 10 years to maintain and rehabilitate the road network as needed, the average PCI will fall from 61 in 2022 to 35 in 2031. The percentage of deficient sections will increase from 53 % in 2022 to 76 % in 2031.
- Spending \$3M/year for the next 10 years will initially maintain the average network PCI at around 64 but will eventually result in a gradual deterioration of the road network to reach an average PCI of 63 in 2031. However, looking at year-by-year results, this level of spending will allow the network average PCI to fall under 60 in 2026 before it goes up again. The Deficiency will decrease from 49 % in 2022 to 42 % by the end of 2031.
- A total spending of \$4M/year is predicted to improve the network average PCI by 1 point initially in 2022 (PCI of 65) and is predicted to reach a PCI of 69 in 2031. The Deficiency is predicted to drop from 48% in 2022 to 34 % in 2031.

CITY OF TUCKER 2021 PAVEMENT MANAGEMENT ANALYSIS REPORT

Summary of Results

January 4, 2022

- Spending \$5M/year and \$6M/year on the network for the next 10 years is predicted to increase the network average PCI to 78 and 92 in 2031, respectively. These amounts will also decrease the respective deficiencies to 23 % and zero (0) by the end of 2031.
- Spending approximately \$37M in 2022 (\$44.3M over the next 10 years) will increase the network PCI initially to 94 and will taper down to 87 over the next 10 years. This unlimited funding scenario is predicted to drop the deficiency significantly to 3 % by end of 2031.
- It is worth noting when comparing the results of the \$6M/year spending and the “Network Needs” spending that when the roads are treated earlier in their life, the total cost over the 10-year analysis period will be less compared to when limited funds are available. While this unlimited funding scenario is hypothetical, it goes to show how important it is to stay on top of the road maintenance and rehabilitation work, when possible.

7.0 CONCLUSIONS AND RECOMMENDATIONS

The following conclusions and recommendations can be withdrawn from this project:

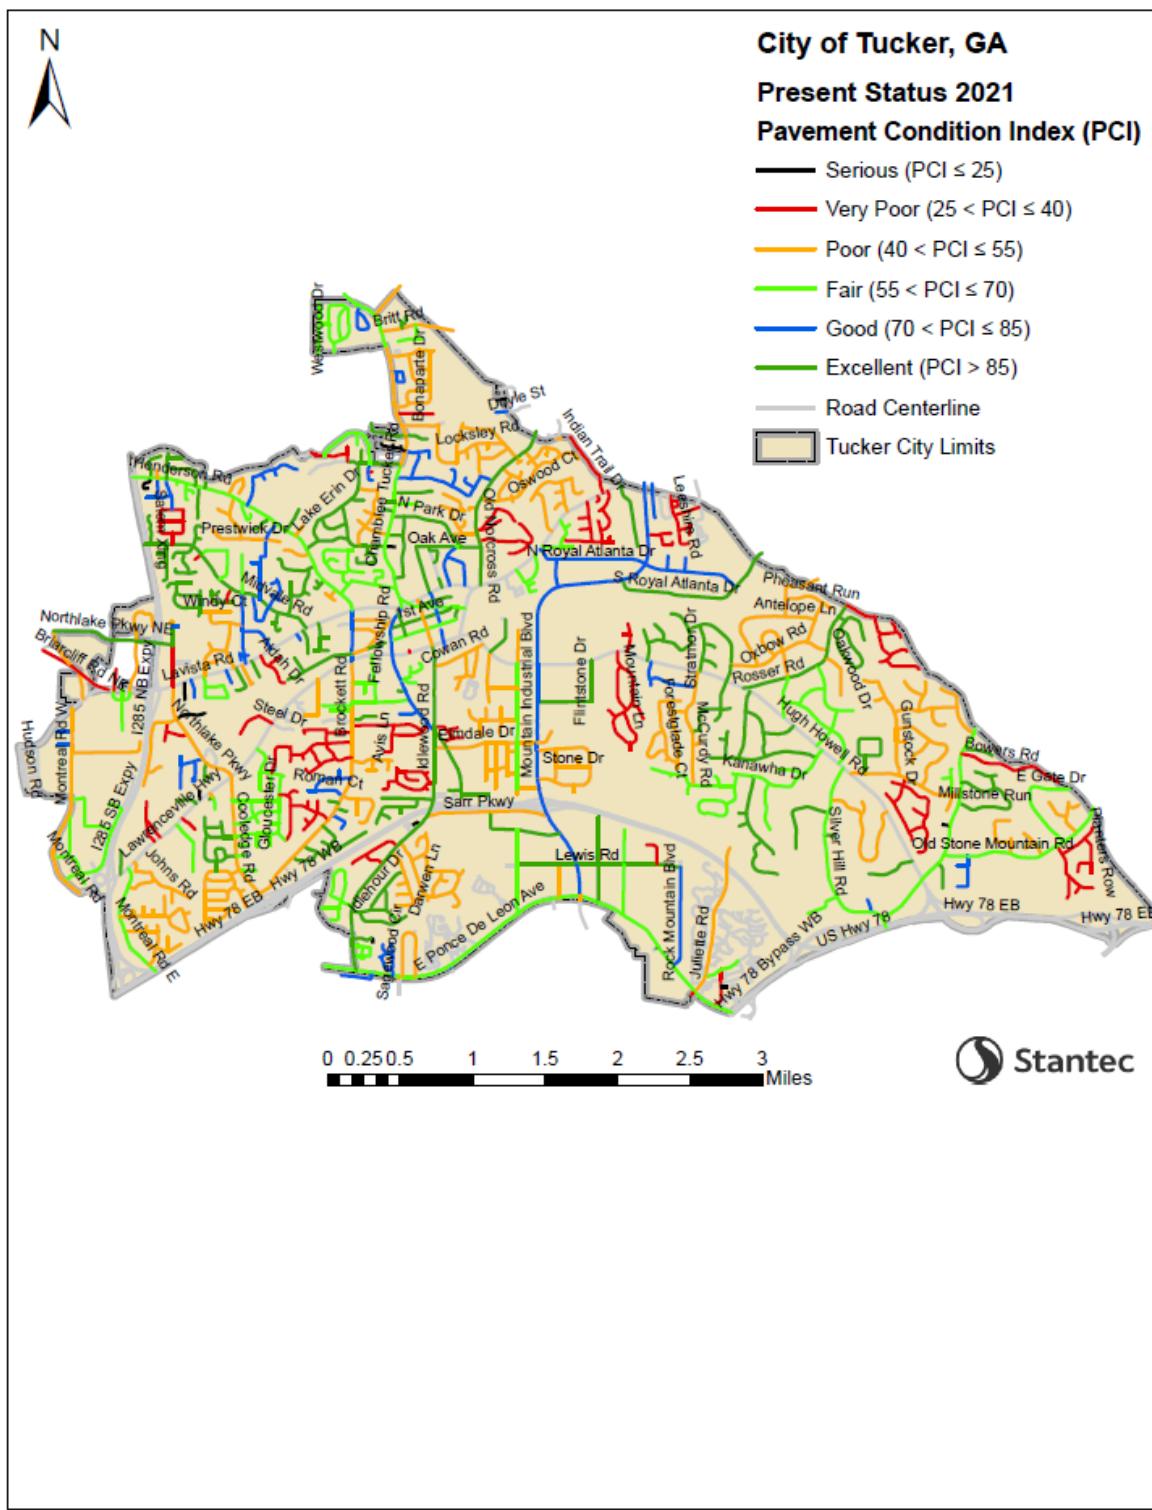

- The Present Status analysis indicates that the City's road network is in "FAIR" condition overall, as seen by the current network PCI score of 64. This is a good improvement from the last survey in 2017.
- On a go-forward basis, the analysis shows that a funding level of approximately \$4.0 Million annually should be implemented to address the rehabilitation needs of the network over the next ten years and continue to improve the network.
- At some point in the near future, the City is encouraged to focus more on preventive maintenance to keep good roads in good condition. This requires that the analysis strategy be shifted from "Worst First" approach to "Cost Efficiency" approach.
- It is recommended that pavement condition assessments be conducted every three years. This will allow the City to track the condition and deterioration of its streets over time using current data. Knowing both the current and trending conditions of the streets provides a true indication of the effectiveness of the City's street maintenance and rehabilitation programs.
- Coupled with the condition data, a pavement management system analysis will provide for an objective prioritization and determine the impacts of annual street maintenance and rehabilitation work under current or proposed funding levels. This will enable the City to exercise effective judgment on funding requirements to meet target network condition levels going forward.
